

Manual Valves

INDUSTRIES:	Packaging, Material Handling, Dispensing
APPLICATION DESCRIPTION:	The customer manufactures pneumatic and hydraulic concrete vibrators and drills. The drills range in size from hand-held devices to those capable of servicing airport runways. The customer needs to control these devices either remotely or manually using mechanically operated air valves without an electrical power source.
PROBLEM:	Excessive amounts of concrete dust generated by these drilling machines are a constant source of accelerated wear and component failure. The units operate outdoors, creating even more stress on the components.
SOLUTION:	To meet the customer's needs, AV provided valves from our compact series with lever operators in two and three position configurations. The customer's assessment of the reliability of the valves is such that AV has become their single source supplier for these valves.
